

R For Data Science Cheat Sheet

data.table

Learn R for data science **Interactively** at www.DataCamp.com

data.table

data.table is an R package that provides a high-performance version of base R's `data.frame` with syntax and feature enhancements for ease of use, convenience and programming speed.

Load the package:

```
> library(data.table)
```

Creating A data.table

<pre>> set.seed(45L) > DT <- data.table(V1=c(1L,2L), V2=LETTERS[1:3], V3=round(rnorm(4),4), V4=1:12)</pre>	Create a <code>data.table</code> and call it <code>DT</code>
---	--

Subsetting Rows Using i

<pre>> DT[3:5,]</pre>	Select 3rd to 5th row
<pre>> DT[3:5]</pre>	Select 3rd to 5th row
<pre>> DT[V2=="A"]</pre>	Select all rows that have value A in column v2
<pre>> DT[V2 %in% c("A", "C")]</pre>	Select all rows that have value A or C in column v2

Manipulating on Columns in j

<pre>> DT[,V2] [1] "A" "B" "C" "A" "B" "C" ... > DT[,.(V2,V3)] > DT[,sum(V1)] [1] 18 > DT[,(.sum(V1),sd(V3))] V1 V2 1: 18 0.4546055 > DT[,(.Aggregate=sum(V1), Sd.V3=sd(V3))] Aggregate Sd.V3 1: 18 0.4546055 > DT[,(.V1,Sd.V3=sd(V3))] > DT[,.(print(V2), plot(V3), NULL)]</pre>	Return v2 as a vector
	Return v2 and v3 as a <code>data.table</code>
	Return the sum of all elements of v1 in a vector
	Return the sum of all elements of v1 and the std. dev. of v3 in a <code>data.table</code>
	The same as the above, with new names
	Select column v2 and compute std. dev. of v3, which returns a single value and gets recycled
	Print column v2 and plot v3

Doing j by Group

<pre>> DT[,(.V4.Sum=sum(V4)),by=V1] V1 V4.Sum 1: 1 36 2: 2 42 > DT[,(.V4.Sum=sum(V4)), by=(V1,V2)] > DT[,(.V4.Sum=sum(V4)), by=sign(V1-1)] sign V4.Sum 1: 0 36 2: 1 42 > DT[,(.V4.Sum=sum(V4)), by=(.V1.01=sign(V1-1))] > DT[1:5,(.V4.Sum=sum(V4)), by=V1] > DT[,N,by=V1]</pre>	Calculate sum of v4 for every group in v1
	Calculate sum of v4 for every group in v1 and v2
	Calculate sum of v4 for every group in <code>sign(V1-1)</code>
	The same as the above, with new name for the variable you're grouping by
	Calculate sum of v4 for every group in v1 after subsetting on the first 5 rows
	Count number of rows for every group in v1

General form: `DT[i, j, by]`

"Take `DT`, subset rows using `i`, then calculate `j` grouped by `by`"

Adding/Updating Columns By Reference in j Using :=

```
> DT[,V1:=round(exp(V1),2)]
> DT
  V1 V2   V3 V4
1: 2.72 A -0.1107 1
2: 7.39 B -0.1427 2
3: 2.72 C -1.8893 3
4: 7.39 A -0.3571 4
...
> DT[,c("V1","V2"):=list(round(exp(V1),2),
LETTERS[4:6])]
> DT[, `:=` (V1=round(exp(V1),2),
V2=LETTERS[4:6])][]
  V1 V2   V3 V4
1: 15.18 D -0.1107 1
2: 1619.71 E -0.1427 2
3: 15.18 F -1.8893 3
4: 1619.71 D -0.3571 4
> DT[,V1:=NULL]
> DT[,c("V1","V2"):=NULL]
> Cols.chosen=c("A","B")
> DT[,Cols.Chosen:=NULL]
> DT[,,(Cols.Chosen):=NULL]
```

v1 is updated by what is after :=
Return the result by calling `DT`

Columns v1 and v2 are updated by what is after :=
Alternative to the above one. With [], you print the result to the screen

Remove v1
Remove columns v1 and v2

Delete the column with column name `Cols.chosen`
Delete the columns specified in the variable `Cols.chosen`

Advanced Data Table Operations

```
> DT[,-N-1]
> DT[,-N]
> DT[,.(V2,V3)]
> DT[,list(V2,V3)]
> DT[,mean(V3),by=.(V1,V2)]
  V1 V2   V3
1: 1 A 0.4053
2: 1 B 0.4053
3: 1 C 0.4053
4: 2 A -0.6443
5: 2 B -0.6443
6: 2 C -0.6443
```

Return the penultimate row of the `DT`
Return the number of rows
Return v2 and v3 as a `data.table`
Return v2 and v3 as a `data.frame`
Return the result of j, grouped by all possible combinations of groups specified in by

.SD & .SDcols

```
> DT[,print(.SD),by=V2]
> DT[,.SD[c(1,.N)],by=V2]
> DT[,lapply(.SD,sum),by=V2]
> DT[,lapply(.SD,sum),by=V2,
.SDcols=c("V3","V4")]
  V2   V3 V4
1: A -0.478 22
2: B -0.478 26
3: C -0.478 30
> DT[,lapply(.SD,sum),by=V2,
.SDcols= paste0("V",3:4)]
```

Look at what `.sd` contains
Select the first and last row grouped by v2
Calculate sum of columns in `.sd` grouped by v2
Calculate sum of v3 and v4 in `.sd` grouped by v2
Calculate sum of v3 and v4 in `.sd` grouped by v2

Chaining

```
> DT <- DT[,(.V4.Sum=sum(V4)),
by=V1]
  V1 V4.Sum
1: 1   36
2: 2   42
> DT[V4.Sum>40]
> DT[,(.V4.Sum=sum(V4)),
by=V1][V4.Sum>40]
  V1 V4.Sum
1: 2   42
> DT[,(.V4.Sum=sum(V4)),
by=V1][order(-V1)]
  V1 V4.Sum
1: 2   42
2: 1   36
```

Calculate sum of v4, grouped by v1

Select that group of which the sum is >40
Select that group of which the sum is >40 (chaining)

Calculate sum of v4, grouped by v1, ordered on v1

set() -Family

set()

Syntax: `for (i in from:to) set(DT, row, column, new value)`

```
> rows <- list(3:4,5:6)
> cols <- 1:2
> for(i in seq_along(rows))
  {set(DT,
    i=rows[[i]],
    j=cols[i],
    value=NA)}
```

Sequence along the values of `rows`, and for the values of `cols`, set the values of those elements equal to NA (invisible)

setnames()

Syntax: `setnames(DT, "old", "new")`

```
> setnames(DT,"V2","Rating")
> setnames(DT,
  c("V2","V3"),
  c("V2.rating","V3.DC"))
```

Set name of v2 to Rating (invisible)
Change 2 column names (invisible)

setnames()

Syntax: `setcolorder(DT, "neworder")`

```
> setcolorder(DT,
  c("V2","V1","V4","V3"))
```

Change column ordering to contents of the specified vector (invisible)
